

Here's where ideas start to become reality. When we transform conceptual designs into technical drawings and detailed specs and we all start nodding at the same time. This is the beginning of all the fun.

When it comes to design, one size does not fit all.

At Chicago Scenic, every project begins with a conversation.

Many of those conversations center on the dream or the design that a client already has. Just as frequently, though, clients ask us to collaborate and, ultimately, design their event, exhibit or experience.

In that scenario, we discuss their ideas and goals, then help them select the right design partner. That designer will produce sketches and renderings that reflect the distinctive nature of the project.

Next up — technical design.

In a seamless transition, once the designs reflect the client's goals and imagination, our technical designers produce construction drawings and as-builts that serve to further define the scope of a project.

When necessary, our technical designers will also test for structural viability, and ensure compliance with safety regulations. Throughout the process, we will ensure that your goals and vision are being met and that the integrity of the design carries through to project end.
